

Research and transfer of technology are the major activities at Serdar Özler Eye Clinic. The primary interest besides clinical areas at the Clinic are biophysics, chemistry and biochemistry, genetics, immunology, microbiology, molecular and cell biology, neurobiology, pharmacology and physiology.

The research areas we closely follow within the field of ophthalmology include cataract, external ocular and corneal disease, glaucoma, neuro-ophthalmology, ophthalmic pathology, orbital and ophthalmic plastic surgery, pediatric ophthalmology and strabismus, and retinal disease. Serdar Özler Eye Clinic specialists are available to evaluate a wide variety of eye conditions, from nearsightedness to eye muscle disorders to retinal diseases.

Our broad scope of expertise makes the Clinic an especially good choice for those who have complex conditions or want a second opinion.
